System Identified: Motion Sensor Light (Hall of the house)

How it works:

The motion sensor light uses a sensor (usually infrared) to detect movement in its surroundings. When a person enters the area, the sensor detects a change in motion or heat.

Trigger:

Movement detected by the motion sensor (e.g., a person walking into the detection area)

Action:

The light automatically turns ON. After a certain period of no movement, the light turns OFF.
