I identified an unsafe situation involving the use of a hair dryer in the bathroom while styling and straightening slightly wet hair. In most PGs, there is usually only one mirror available inside the bathroom, so people often use electrical styling devices there for convenience. However, bathrooms are damp environments with water sources nearby, which makes the use of electrical appliances risky. Water and electricity together can lead to electric shocks, short circuits, or even fire hazards if the hair dryer or plug comes into contact with moisture. Wet hands and slippery floors can further increase the chances of accidents.

A safer alternative is to dry the hair partially with a towel and then use the hair dryer in a dry room outside the bathroom, preferably near a dressing mirror. Extension mirrors or portable mirrors can also help reduce the need to use electrical devices in wet areas. Additionally, ensuring that hands, floors, and sockets are dry before using the appliance can improve safety.
